Simplicity pays

Each year 45,000 researchers waste a significant amount of working hours performing various administrative tasks.

Identical information is repeatedly transmitted, thereby causing unnecessary workload.

By creating a highly efficient data environment, all desired information is made available once and can be reused instantly by all competent parties.

Each saving of one percent of the researcher's working hours means an annual benefit of

9.5 million euro

This reduction of workload ensures that the scientific research budget is being used most effectively.

It allows researchers to fully focus on their core business: scientific research.

Increasing
innovation
by
connecting
information

No measuring without knowing

Linking and aggregating data will enable the government to adapt its policy, evaluate it accurately and make quick corrections.

Scientific organisations need consolidated information to take appropriate decisions on their research policy and optimally use their budget resources.

Better access to knowledge

The adoption of an open architecture facilitates cross-border cooperation and development of research networks.

Industrial actors will be able to identify more easily partners for innovative projects.

By using international standards, policy makers will be able to weigh up their policy options against those of other countries and governments.

The international dimension of research projects and organisations will be strongly stimulated.
