1. Algemeen heden

In deze notitie zijn de waterstand- en debietgegevens opgenomen voor de periode 1974 t.e.m. 1996 van het hydrometrisch station Dijle/Wilsele-Wijgmaal, dat beheerd wordt door de dienst Hydrologisch Onderzoek (DIHO).

Het station is te Wilsele-Wijgmaal sedert 14 Nov 73 ingeplant op de rechteroever van de Dijle stroomafwaarts van de oude brug van de Weggevoerdenstraat.
De coördinaten van deze inplanting zijn: OL : 04°42'27" - NB : 50°55'34".

Ter plaatse van het station is de oppervlakte van het stroomgebied van de Dijle 899,90km².

Er dient wel rekening gehouden te worden met het feit dat in Leuven een deel van het debiet van de Dijle wordt afgeleid naar het kanaal Leuven-Dijle.

Bijlage 1 geeft de ligging van het hydrometrisch station.

De waterstanden worden permanent door een limnigraaf geregistreerd. Via een teletransmissielijn worden deze gegevens doorgegeven aan de centrale computer van DIHO te Brussel, die de gemiddelde uurlijkse waterstandgegevens in een bestand opneemt.

Bij middel van regelmatig uitgevoerde debietsmetingen met snelheidsmolens worden krommen voor de relatie waterstand-debit opgesteld. Deze krommen worden regelmatig nagekeken en eventueel bijgewerkt.

Verdere berekeningen geven de gemiddelde etmaal-, maand- en jaarwaarden van waterstanden en debieten.

2. Jaaroverzichten van de waterstandgegevens

Bijlagen 2 t.e.m. 24 geven de jaaroverzichten met de gemiddelde etmaal-, maand- en jaarwaterstanden van de periode 1974 t.e.m. 1996.

Vanaf begin Mei 94 merkt men een beïnvloeding van de waterstanden in het hydrometrisch station door de ingebruikneming van de stuwdam van Rotselaar.

3. Jaaroverzichten van de debietgegevens

Bijlagen 25 t.e.m. 45 geven de jaaroverzichten met de gemiddelde etmaal-, maand- en jaardebieten van de periode 1974 t.e.m. 1994 (maanden Jan t.e.m. Apr).

Vanaf begin Mei 94 kunnen tot nu toe geen debieten meer bepaald worden omdat de bestaande relatie waterstand-debit voor het hydrometrisch station niet meer geldig is door de in § 2 vermelde beïnvloeding van de waterstanden.

4. Algemene bespreking van de waterstand- en debietgegevens

4.1. Meerjarig overzicht van de debieten 1974 t.e.m. 1993

Bijlage 46 geeft dit meerjarig overzicht.

Naast de gemiddelde maand- en jaardebieten zijn eveneens de minimum en maximum maand- en jaardebieten opgegeven.

4.2. Overschrijdingswaarden van de debieten 1974 t.e.m. 1993

Op bijlage 47 zijn de verschillende overschrijdingswaarden van de debieten voor de volledige periode 1974 t.e.m. 1993 bij elkaar gebracht.

4.3. Overzicht van de jaarlijkse topwaterstanden en -debieten

Op bijlage 48 zijn de gemiddelde uurlijkse topwaterstanden en -debieten, die werden geregistreerd in het hydrometrisch station, bij elkaar gebracht.

4.4. De herhalingsfrequentie van de topdebieten

Wat zijn de herhalingsfrequenties van de topdebieten van de Dijle in het hydrometrisch station Wilsele-Wijgmaal?

Vooreerst dient er nogmaals aan herinnerd te worden dat zulke herhalingsfrequentie wordt bepaald om de kans in te schatten, waarmee elk jaar zich dergelijke of hogere topdebieten kunnen voordoen.

Zeer vaak zegt men ook dat een herhalingsfrequentie het aantal jaren aangeeft, dat gemiddeld tussen dergelijke debieten verstrijkt. Zulke formulering is gebrekkig daar zij niet aangeeft dat er zich ook twee jaren achtereen hoge topdebieten kunnen voordoen.

Voor de bepaling van de herhalingsfrequentie wordt gebruik gemaakt van een frequentie-analyse met de Gumbel-verdeling, die de meest gebruikte verdeling in de hydrologie is.

Bij gebruik van de topdebieten van de periode 1975 t.e.m. 1996, m.a.w. de laatste twintigjarige periode, vindt men volgende herhalingsfrequenties:

| | |
|------------------------------------|------|
| topdebit 29,19 m ³ /s : | 1/10 |
| topdebit 31,39 m ³ /s : | 1/20 |
| topdebit 34,23 m ³ /s : | 1/50 |

Het topdebit 30,04 m³/s van 29 Aug 96 heeft een herhalingsfrequentie van 1/13.

Er dient hier nogmaals herinnerd te worden aan het feit dat in Leuven een deel van het debiet van de Dijle wordt afgeleid naar het kanaal Leuven-Dijle.

5. De hoge waterstand van 29-30 Aug 96

Op 29 en 30 augustus 1996 heeft de Dijle uiterst hoge waterstanden en debieten gekend.

Bijlage 49 geeft de waterstanden van de periode 27 Aug t.e.m. 02 Sep 96.

Zoals reeds hoger vermeld, bedraagt het gemiddeld uurlijks topdebiet van de Dijle te Wilsele-Wijgmaal, dat zich heeft voorgedaan op 29 Aug te 13h, 30,04 m³/s.

Het is het hoogste gemiddeld uurlijks debiet dat sedert het begin van de waarnemingen, begin 1974, in het DIHO-station werd geregistreerd.

Op de vraag of de neerslag die dagen zo uitzonderlijk was, geeft het Koninklijk Meteorologisch Instituut van België een duidelijk antwoord:

Na 13 maanden met weinig neerslag gingen op 28 en 29 Aug de hemelsluizen meer dan ver open, want de neerslagsom voor die twee dagen samen bedraagt te Ukkel 113,1mm.

Te Rillaar en Beauvechain worden voor die dagen als neerslagsom respectievelijk 111,5mm en 108,7mm geregistreerd.

De neerslagsom van 113,1mm te Ukkel is bijna de helft van de neerslagsom van de ganse maand augustus, die 231,2mm bedraagt en voor deze locatie de record-neerslagsom voor een augustusmaand is sedert het begin van de waarnemingen in 1833. Het vorige record dateert uit 1850, toen 197,4mm werd geregistreerd.

Het neerslagtotaal van 231,2mm heeft er zelfs voor gezorgd dat augustus 1996 na oktober 1932 de natste maand is, die men ooit sedert 1833 heeft meegeemaakt.

Het is tijdens de laatste decade, toen er te Ukkel 158,7mm regen valt, dat het record vorm heeft genomen. Deze decade was hierdoor veel natter dan de natste decade die men ooit heeft waargenomen te Ukkel sedert 1901, nl. de tweede decade van juni 1963 toen men 120,3mm registreerde.

De zeer overvloedige neerslag op 12, 28 en 29 Aug vertoont geen uitzonderlijk karakter. Het is normaal dat men drie tot zeven dagen tijdens een jaar dagwaarden van meer dan 60mm registreert; dagwaarden van meer dan 80mm meet men normaal tijdens drie dagen.

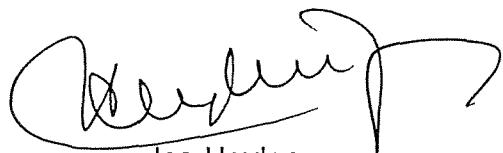

Het is over de periode van 48 uren, nl. van 28 Aug/8h tot 30 Aug/8h, dat de gecumuleerde neerslag een uitzonderlijk tot zeer uitzonderlijk karakter vertoont. Een uitzonderlijk karakter betekent volgens het KMI dat het verschijnsel éénmaal in 30 jaren bereikt of overtroffen wordt, terwijl men van een zeer uitzonderlijk karakter spreekt bij verschijnselen, die éénmaal in 100 jaren bereikt of overtroffen worden.

Over het ganse Dijlebekken is de gecumuleerde neerslag van 28 Aug/8h tot 30 Aug/8h hoger dan 100mm geweest, terwijl hij voor het Dijlebekken in het

Waalse gewest zelfs hoger lag dan 120mm.

Hierdoor krijgt deze neerslag in het ganse Dijlebekken een uitzonderlijk karakter; voor het Dijlebekken in het Waalse gewest en het bekken ten N van de lijn Overijse-Leuven moet men zelfs spreken van een zeer uitzonderlijk karakter.

Brussel, mei 1997
